Shooting stars, or meteors, are caused by tiny specks of dust from space. These particles burn up 65 to 135 km above Earth's surface as they plunge at terrific speeds into the upper atmosphere, making the air glow as they pass.

What is a shooting star? | Space for life

caixa apost

When a meteoroid enters Earth's upper atmosphere, it heats up due to friction from the air. The heat causes gases around the meteoroid to glow brightly, and a meteor appears. Meteors are often referred to as shooting stars or falling stars because of the bright tail of light they create as they pass through the sky.
